

Sprint 2 Retro

What Went Well

- Our demonstration went well
- Our deliverable went above the requirements
- We supported each other as a team
- Efficient use of tools
- Team members adapted well to changes and unexpected challenges
- Issues were identified and resolved quickly, minimizing disruption to the workflow
- The team was aligned on the main sprint goals, which helped in maintaining focus
- Effective delegation of tasks allowed us to distribute the workload evenly.
- Cross-functional collaboration improved our understanding of different components of the project.
- The sprint was completed on time.
- Team members actively proposed solutions to emerging issues rather than waiting for direction. Proactive problem-solving.

What Could be Improved

- Scheduling more efficiently with the demis and our PO
- Code reviews to catch potential issues and maintain code quality
- More use of merge requests to ensure correctness of code.
- Some features took longer than expected, highlighting the need for more accurate task estimations during sprint planning.
- More frequent updates on progress could help team members stay aligned and provide earlier visibility into any delays.
- Although the sprint was completed on time, team members must complete their tasks early rather than waiting to complete work right before deadlines.

Plans for Sprint 3

Sprint 3 focuses on MVP enhancement. By the end of sprint 3 our fully functional MVP will be adapted to include additional features. We brainstormed the following additional features to be completed for sprint 3:

- **Additional payment methods:** A mockup payment system will be implemented by means of a Pourtal Wallet
- **Accessibility:** Enhance the UI by making it more accessible. Discussed the following options:
 - Keyboard navigation
 - Alt text for images
 - ARIA
- **Customer rating system** for drinks and services.
- Allowing administration to set **promotions and discounts** on selected items.
- **Responsiveness:** Allow customer UI to be viewed correctly in mobile view. Scaling app to mobile view.
- **Decline button:** Allow merchants to decline orders
- **Password security:** Store passwords securely in the database by salting and hashing them, instead of saving them in plain text.
